Resilience Enhancing to adapt FORests to Climate change Effects

RENFORCE
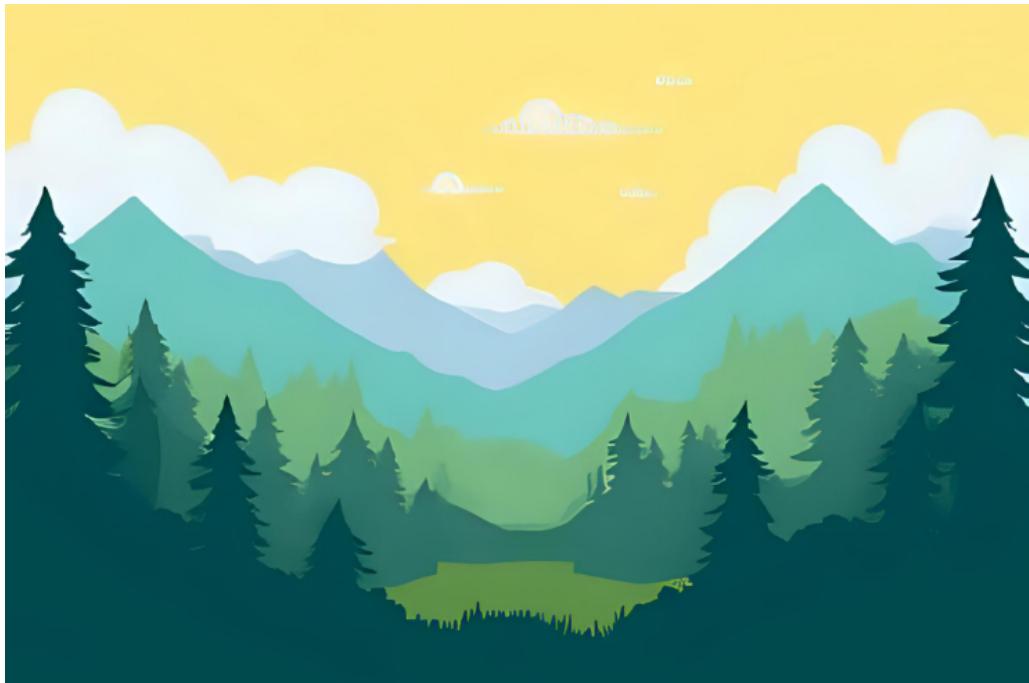

The aim of RENFORCE is to identify, test and promote innovative approaches, techniques, and tools to streamline prevention measures to preparedness and response capacity actions, as well to integrate large fires and wind risk management into forest planning. In addition, it aims at an improved integration between relevant actors and policies with a broad social participation.

Forest Science and Technology Centre of Catalonia (CTFC), is engaged in the RENFORCE project in the role of "knowledge PP". It will facilitate the development process and implementation of all testing activities during the whole project duration. CTFC will focus its intervention on key issues, including environmental function equilibrium, climate change adaptation, competitiveness along value chains and transferring to society.
